PORTFOLIO

Naufal Rizqullah Firdaus

Selected Works of Web
Dev, IoT & Automation

2025

Naufal R. Firdaus

Web Developer & Hardware Engineer

About Me 02

Short introduction about my background, interests, and motivation in technology.

Experience 03

Overview of my internship, organizational work, and key technical experiences.

Portfolio 06

Selected projects showcasing my skills in IoT and web development

Projects 07

Detailed breakdown of individual projects, contributions, and impact.

Honor & Awards 08

Achievements from competitions and recognitions in technology fields.

Contact Me 10

Get in touch for collaboration, opportunities, or project discussions.

Hello..

My Name is Naufal, and I am a Computer Engineering student with a strong focus on web development, the Internet of Things (IoT), and artificial intelligence (AI). Through practical projects, technology competitions, and internships, I have gained hands-on expertise in building full-stack applications, integrating IoT devices with cloud platforms, and designing data-driven smart solutions.

I have experience in end-to-end system architecture, collaborative teamwork, and technology research, with a deep interest in how AI and IoT can enhance efficiency and unlock new opportunities for innovation. Flexible and analytical, I am committed to delivering functional, impactful, and sustainable solutions.

Education

IPB University — *2022-2026 (Expected)*
Computer Engineering Technology

SMKS Nasional Depok — *2019-2022*
Computer & Network Engineering

Work Experience

PT Telkom Indonesia — *Mar 2025 - Present*
Class Manager

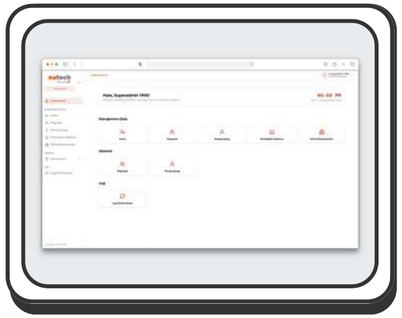

PT Nutech Integrasi — *Feb 2025 - Jul 2025*
Hardware Engineer (Intern)

Organization Experience

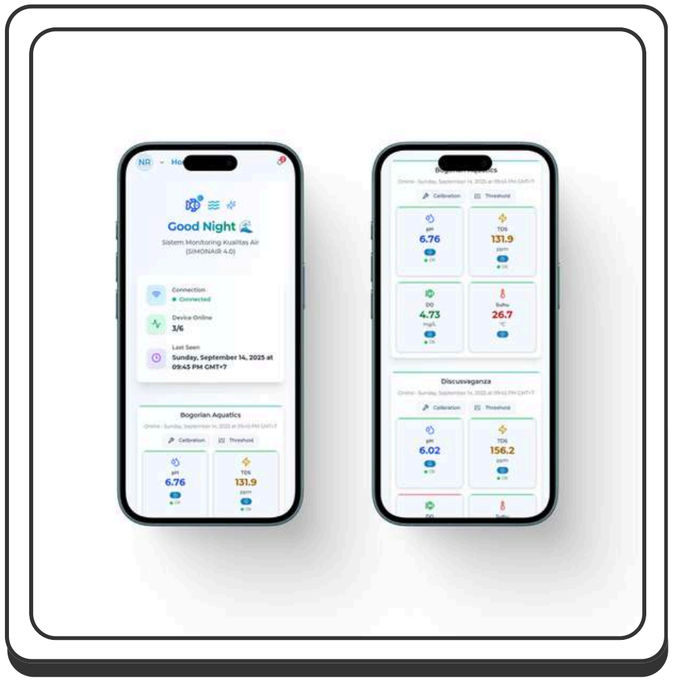

GDGoC IPB — *Sep 2025 - Present*
Co-Lead Chapter IPB University

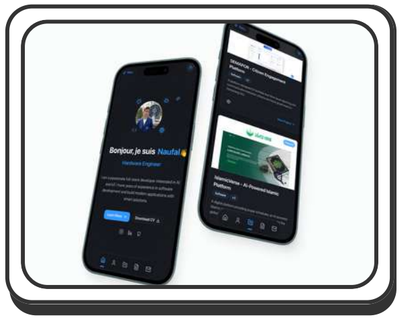

Digistar Club — *Jul 2024 - Present*
Digital Network Club Ranger (Event & Creative)

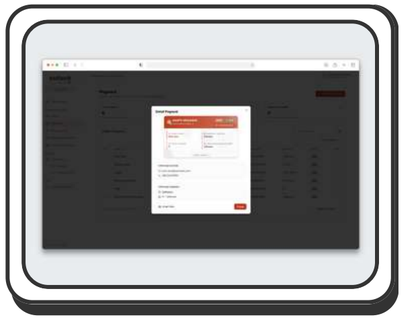

Himavo Micro IT Community — *2022 - 2024*
Staff & Webmaster Mentorship

IoT & Web Development Projects

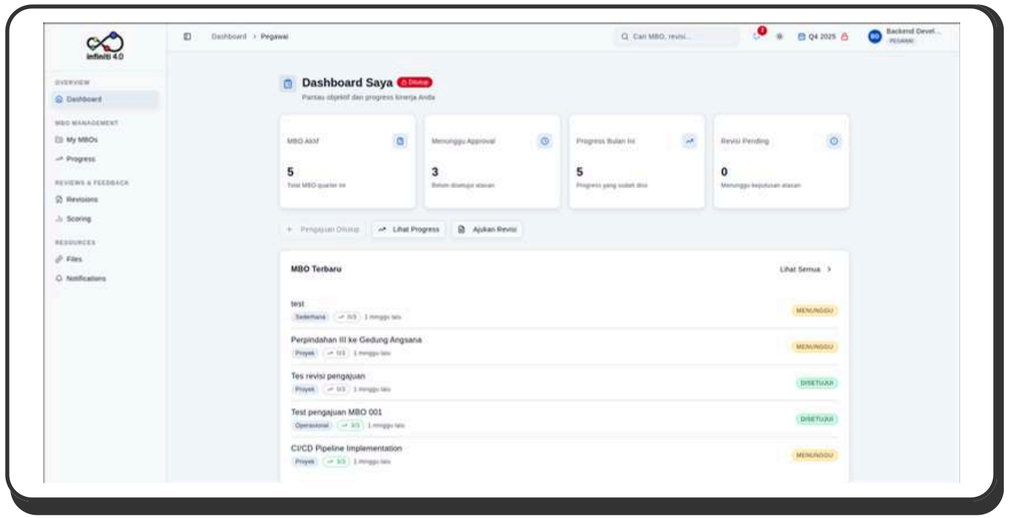

Infinitigroup HRIS : MBO Module (2025)

This project involved the development of an internal HRIS module to support Management by Objectives based performance appraisal within Infinitigroup. The system helps HR teams and managers define objectives, monitor progress, and conduct structured employee evaluations in one centralized platform.

The application was built with a focus on data consistency, scalability, and ease of use to support internal HR workflows.

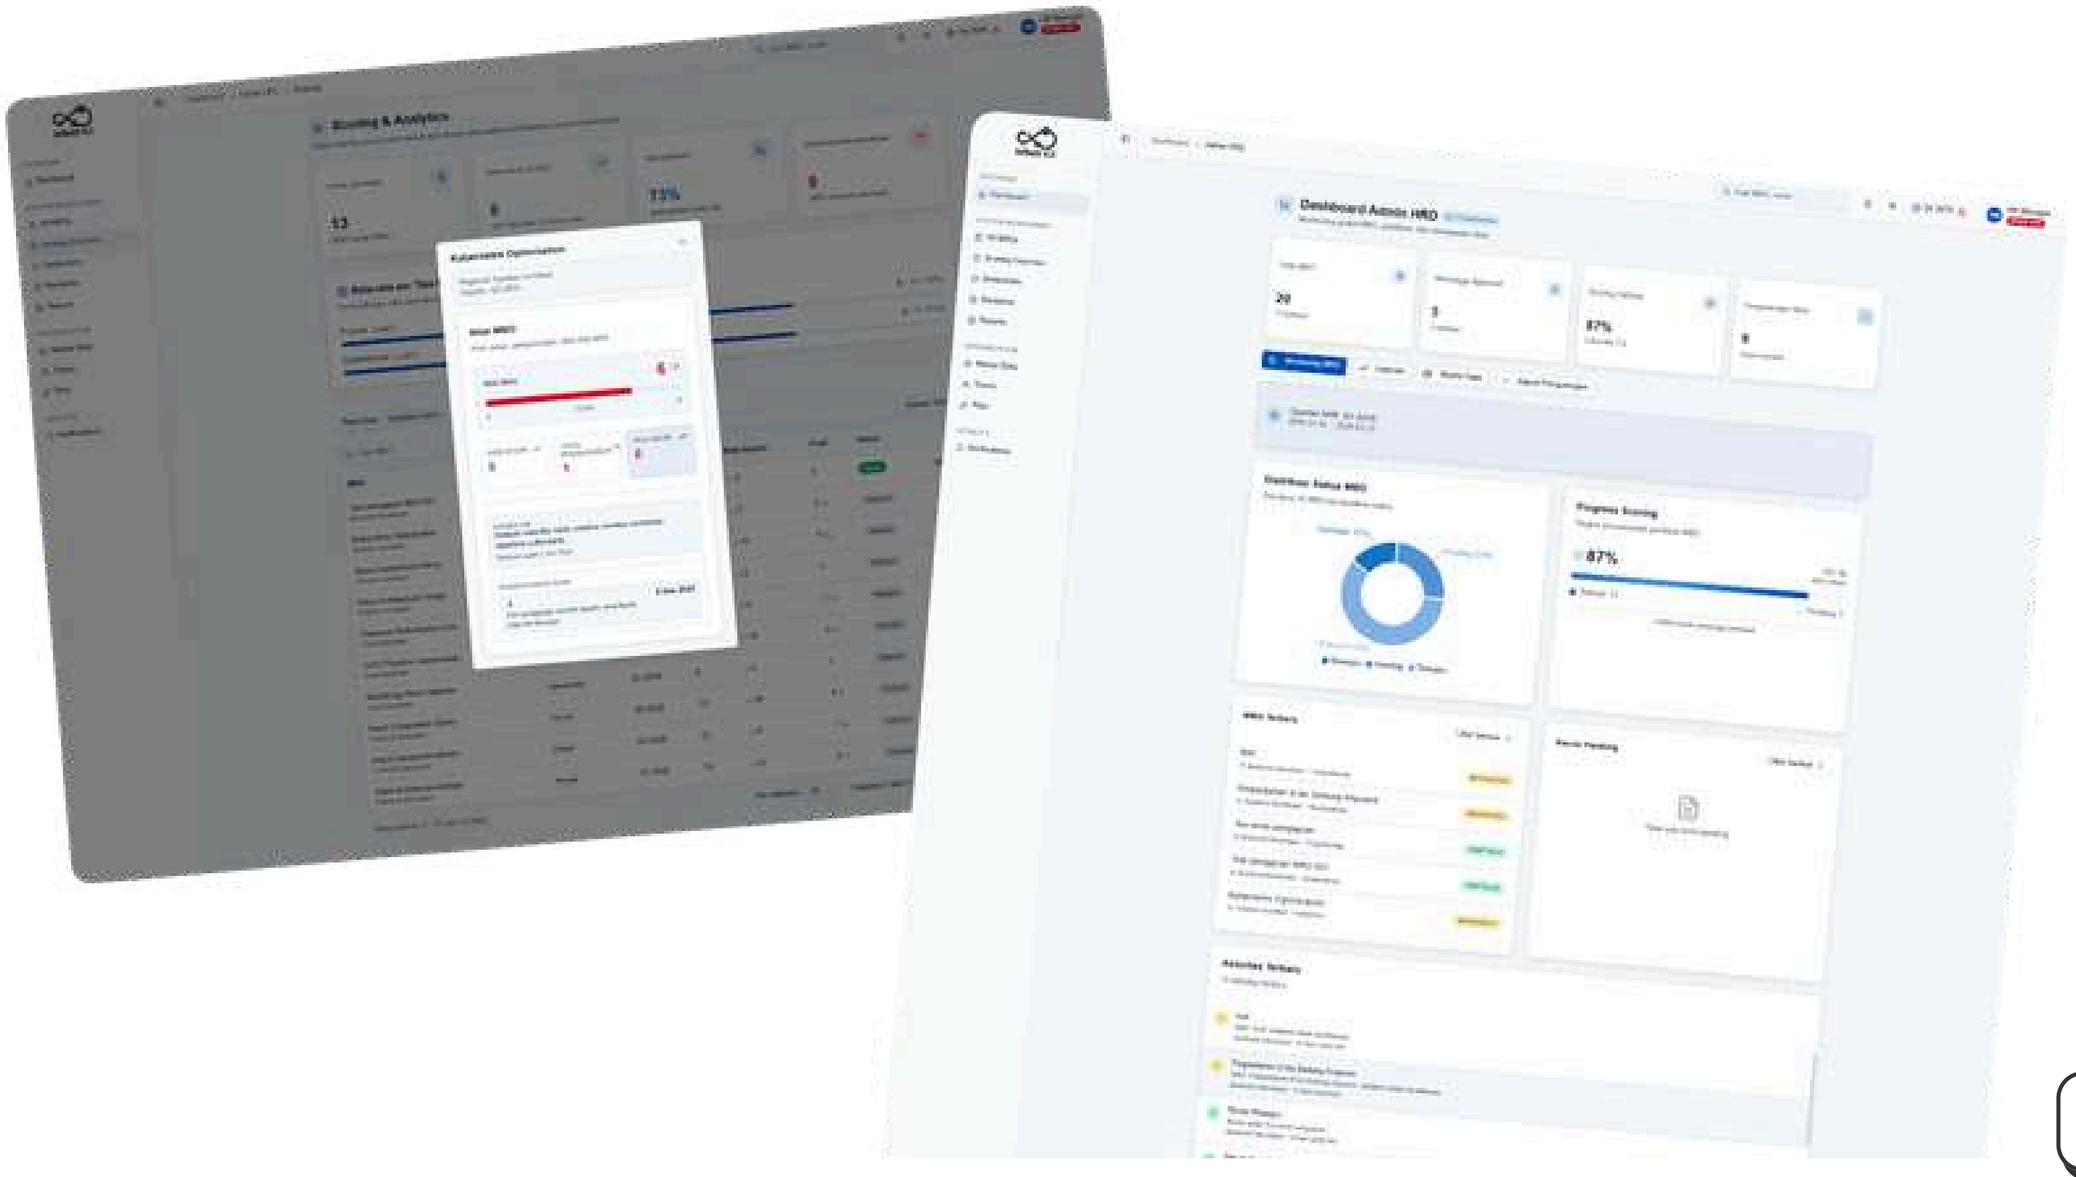

Features:

- Employee objective and KPI management
- Performance evaluation and appraisal tracking
- Secure internal system with structured relational data

Built with:

Project at infiniti 4.0

Indonesia Human Development Center (2025)

This project involved building a static landing page to present programs, initiatives, and organizational information for Indonesia Human Development Center. The website was designed to be clean, accessible, and easy to navigate across different devices.

The main focus of this project was on responsive layout implementation and clear information delivery using a modern frontend stack.

Features:

- Responsive and mobile friendly layout
- Clear content structure for institutional information
- Lightweight static pages with fast load performance

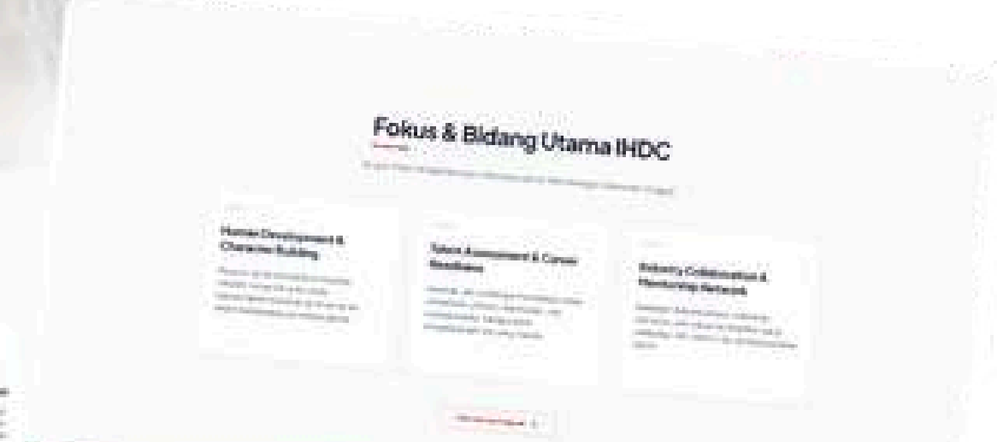

Built with:

Siap Impact SAKINA (2025)

This platform was developed to support the online registration process for the Siap Impact SAKINA program under the Ministry of Population and Family Development (Kemendukbangga). The system enables participants to register digitally while allowing organizers to manage submissions more efficiently.

The project focuses on delivering a smooth registration experience and reliable data handling for program administration.

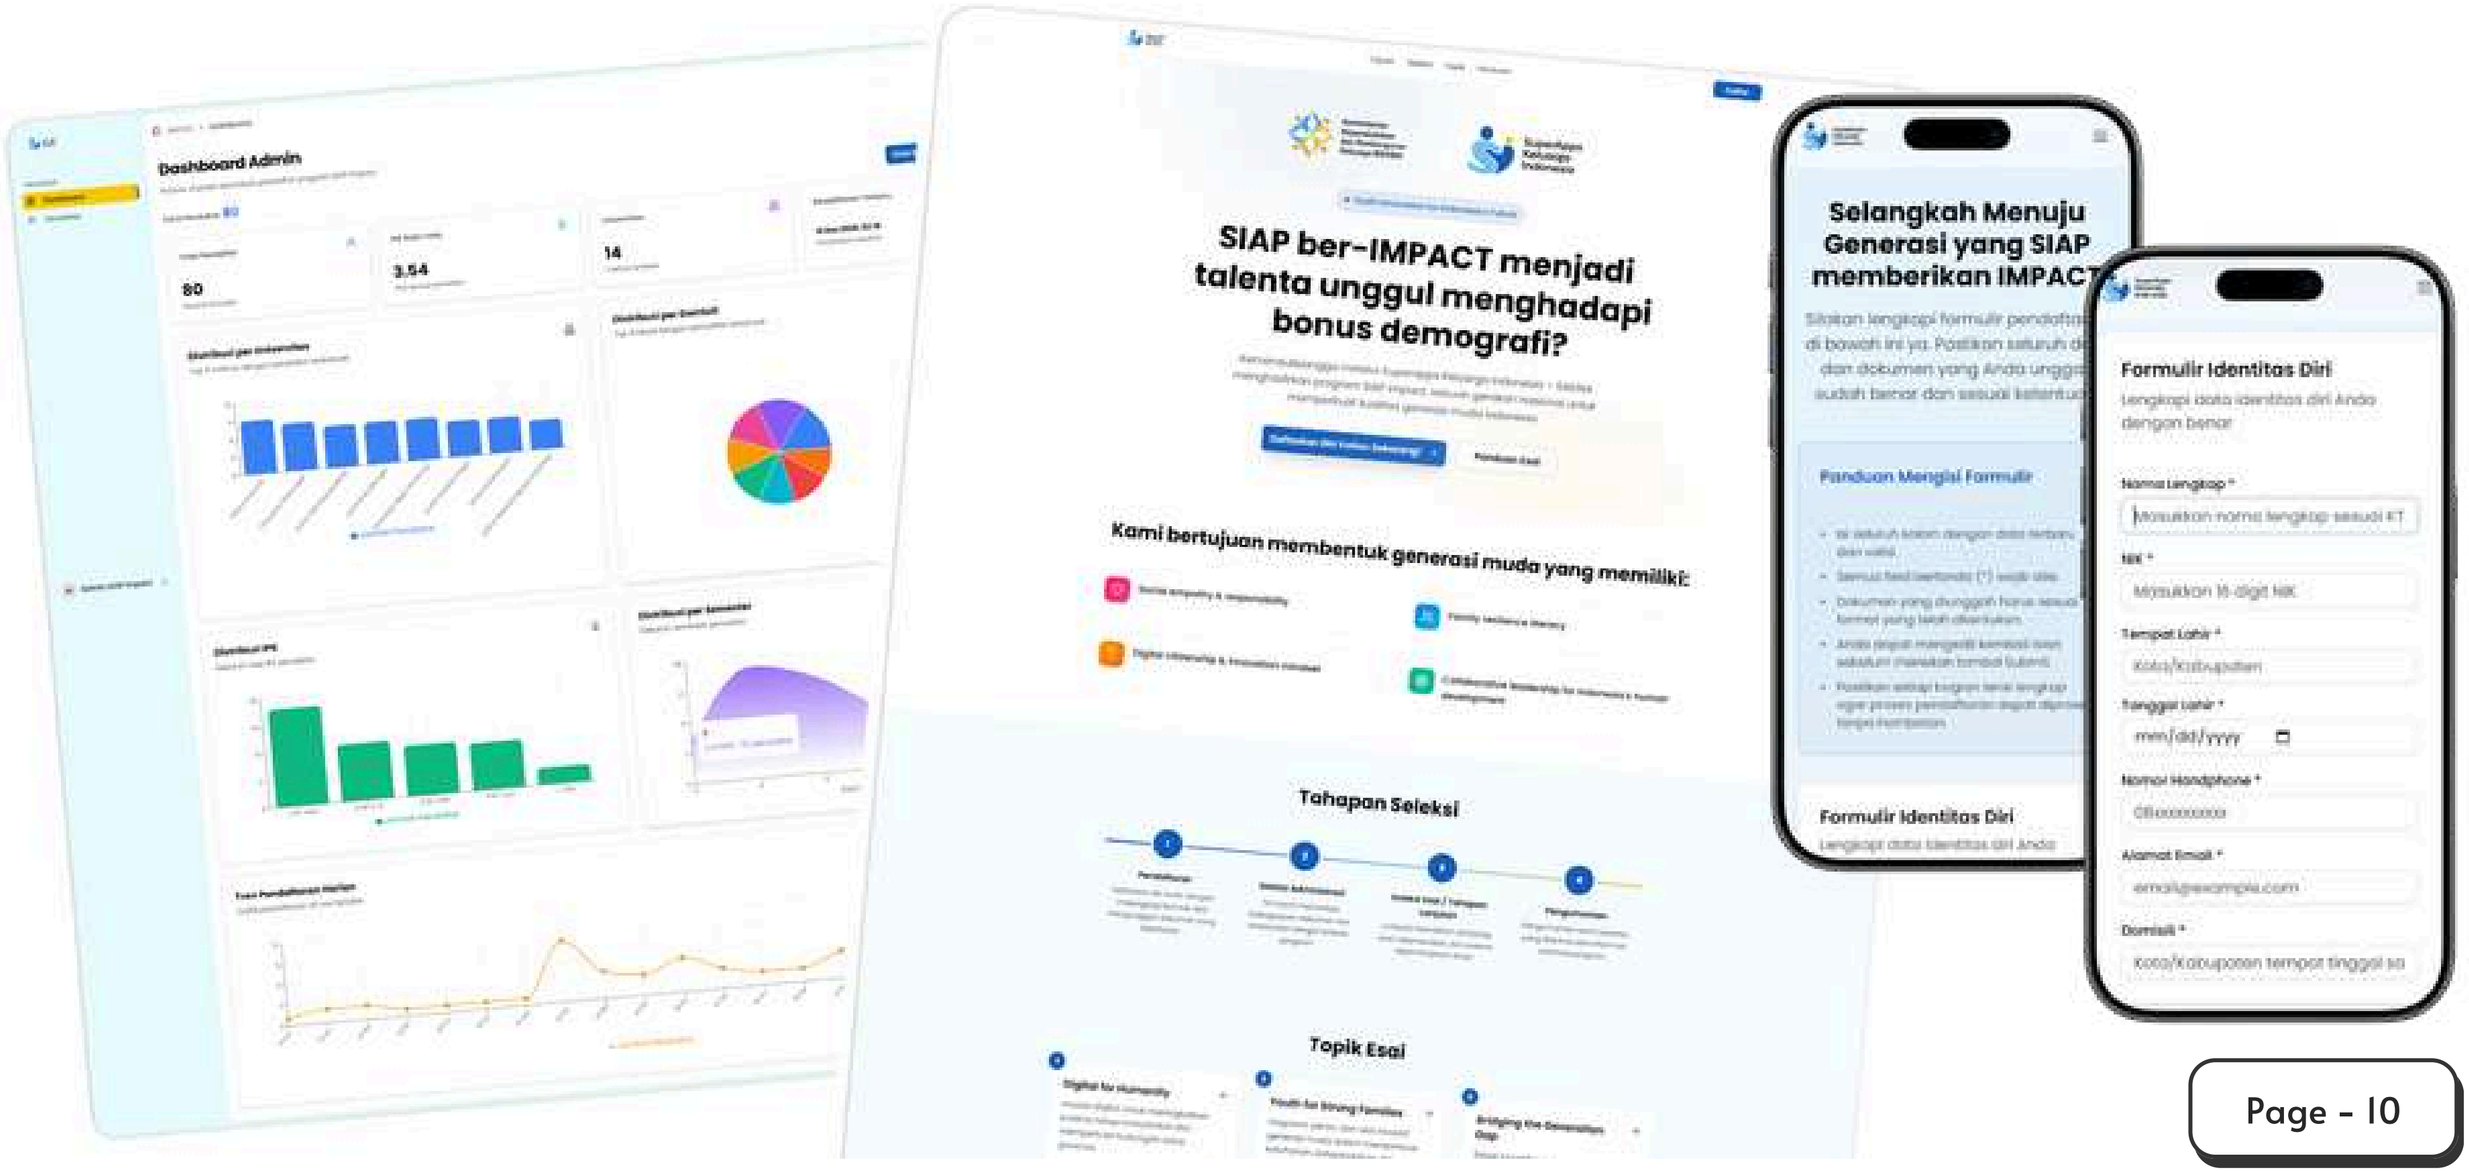

Features:

- Online participant registration system
- Structured data management for organizers
- Responsive interface for desktop and mobile users

Built with:

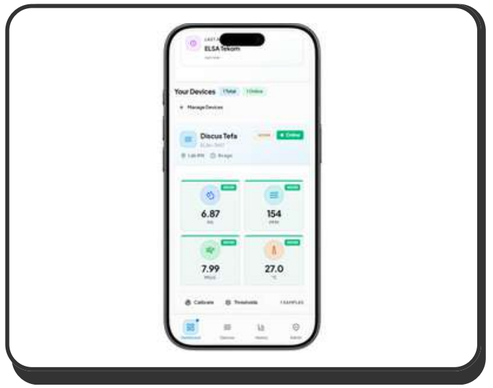

Laravel, React, Tailwind CSS, MySQL

ELSA IoT (2025)

ELSA IoT is a lightweight real time water quality monitoring system designed as a simplified version of SIMONAIR. The system focuses on essential monitoring needs while maintaining reliable data transmission and accessibility.

I built this system by integrating ESP32 S3 with cloud based data storage and a web dashboard, enabling users to monitor sensor data remotely through a responsive interface.

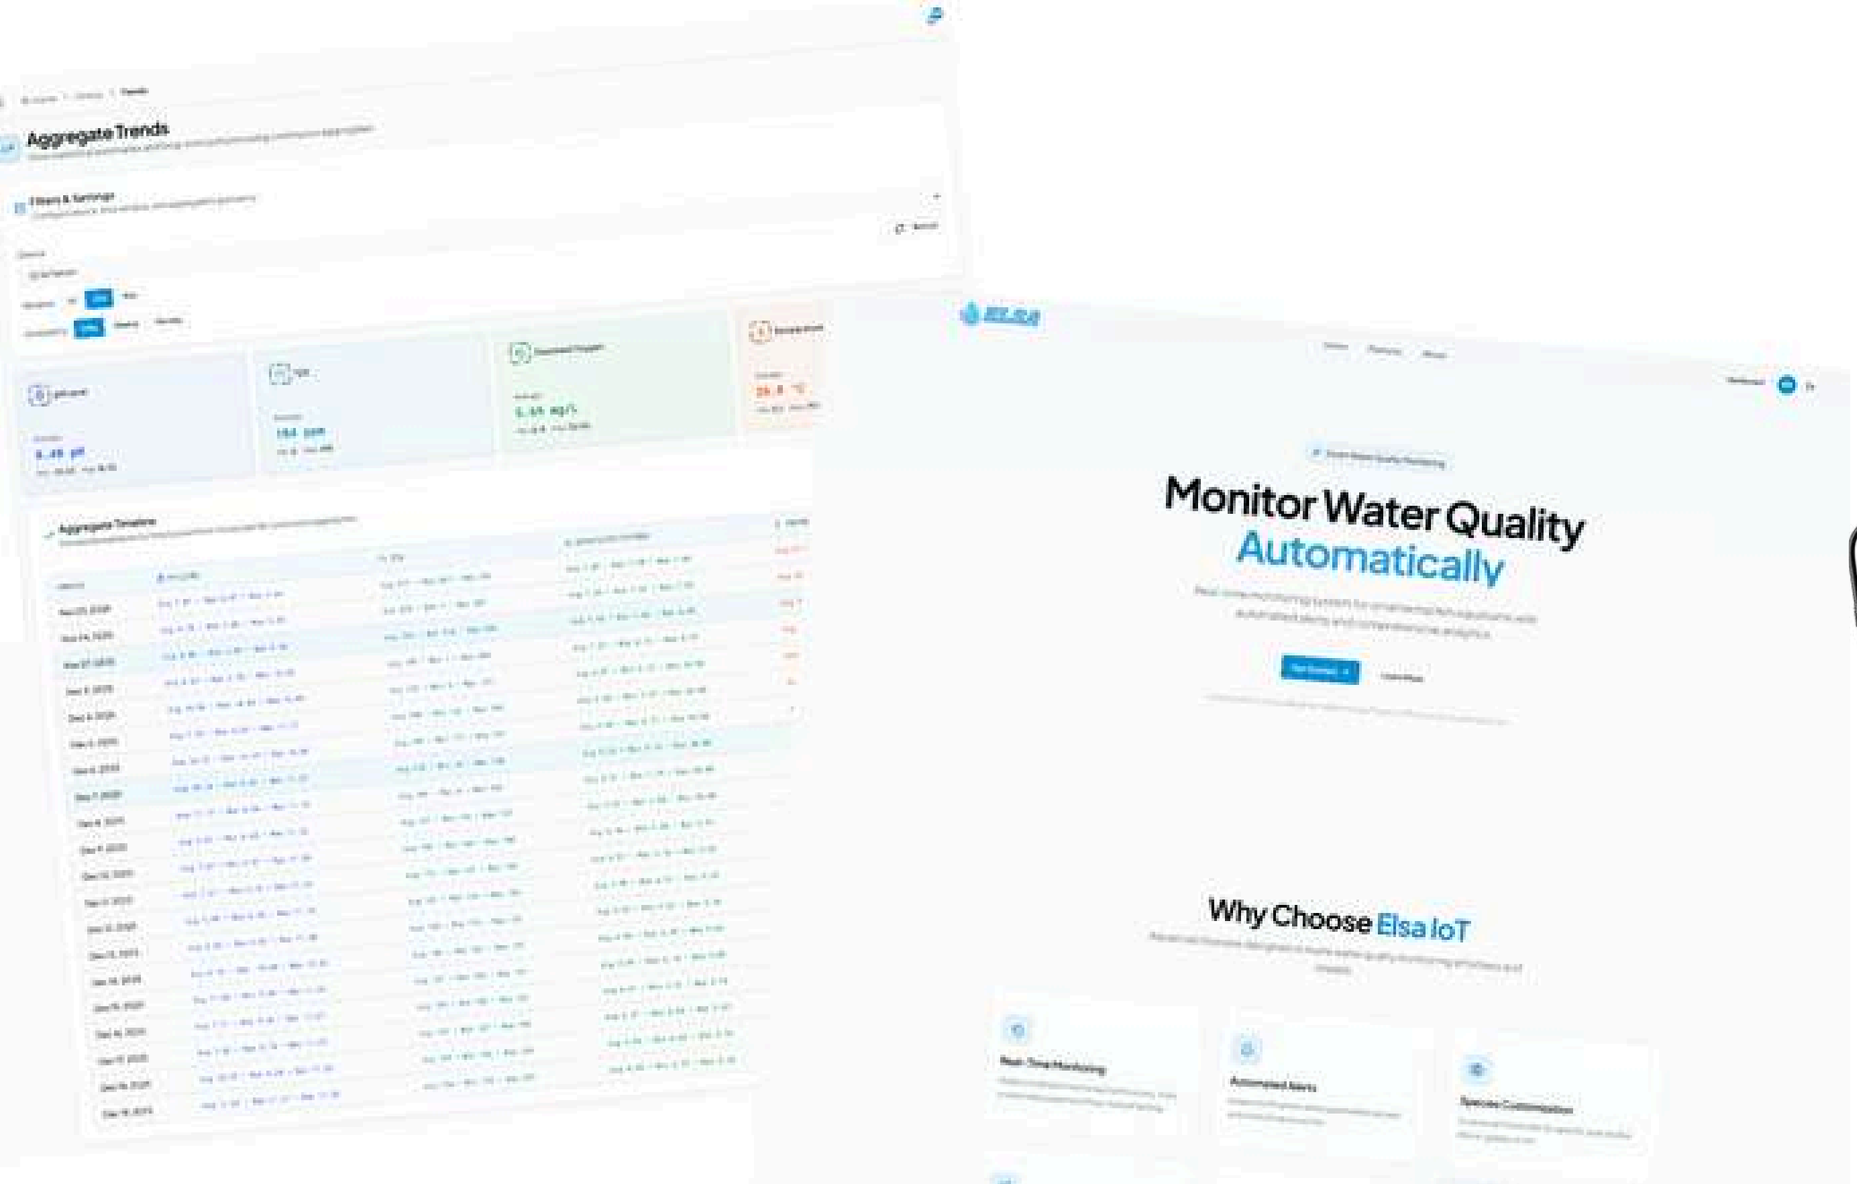

Features:

- Real time water quality data monitoring
- Cloud based data storage and synchronization
- Responsive web dashboard for multi device access

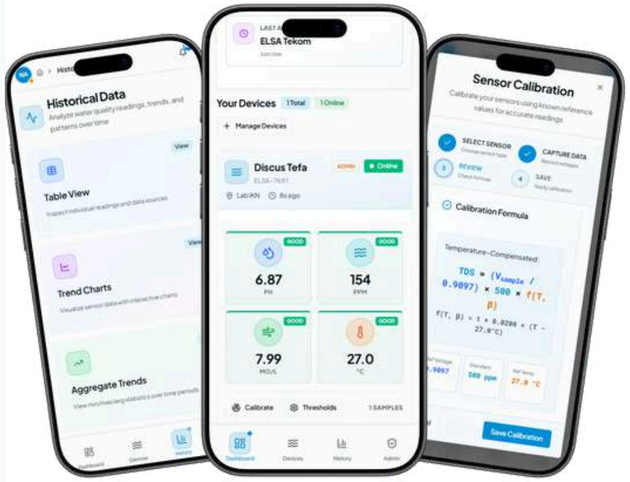

Built with:

SIMONAIR 4.0 (2025)

SIMONAIR 4.0 is the fourth iteration of an ongoing project developed for academic research, designed to monitor the water quality of freshwater ornamental fish aquariums. I independently built this system from start to finish, connecting pH, TDS, DO, and temperature sensors to a Raspberry Pi 4, transmitting data via MQTT, and displaying it through a web dashboard optimized for mobile devices.

This platform provides real-time insights to support better fish care and informed decision-making in fish farming practices.

Features:

- Real-time water quality monitoring
- Mobile-first dashboard UI

GDGoC IPB University (2025)

As part of the Google Developer Group on Campus (GDGoC) IPB, I designed and built a registration platform to simplify the registration process for prospective core team members, mentors, and active members independently. This platform simplifies the registration process and improves overall community management.

Built using Next.js and Supabase, the system ensures secure data handling and multi-device accessibility. It reduces manual errors, saves significant administrative time, and increases participation in the community.

Features:

- Online registration for 3 tracks
- Structured data handling with Supabase
- Responsive UI for multi-device access

Built with:

Visitor Management System (2025)

This project was developed independently during an internship at PT Nutech Integrasi, with a focus on improving workplace security and attendance automation. I built a full-stack system using React, Express, and PostgreSQL, and implemented facial scanning and NFC card readers for secure identity verification.

This solution streamlines the check-in process for employees and visitors, reducing manual work while strengthening access security. From this project, I learned how to integrate web technology with hardware authentication systems to provide reliability and ease of use.

Features:

- Face recognition–based verification
- NFC card integration
- Real-time attendance dashboard

Built with:
